Loops

Python has two primitive loop commands:

- **while** loops
- **for** loops

For Loop

A for loop is used for iterating over a sequence (that is either a list, a tuple, a dictionary, a set, or a string).

This is less like the for keyword in other programming languages, and works more like an iterator method as found in other object-orientated programming languages.

With the for loop we can execute a set of statements, once for each item in a list, tuple, set etc.

Syntax:

```
for x in my_list:  
    # Code
```

```
fruits = ["apple", "banana", "cherry"]  
for x in fruits:  
    print(x)
```

range Function

To loop through a set of code a specified number of times, we can use the `range()` function, The `range()` function returns a sequence of numbers, starting from 0 by default, and increments by 1 (by default), and ends at a specified number.

Syntax:

```
range(start, end, step)
```
